A study of the physics of single surfaces or interfaces begins with the characterization of the shape of the interface. The chapter reviews classical statistical mechanics, includes a description of fluctuations about equilibrium and of binary mixtures.

Thermodynamics of Surfaces and Interfaces

An interface constitutes the separation surface between two phases. A phase constitutes a homogeneous part of a thermodynamic system, i.e., the part of the universe that is under investigation.

Bookmark File PDF

The system has always to be defined by the investigator before she/he starts to perform some studies.

Bookmark File PDF

Surface tension is defined as the intensity of the molecular attraction per unit length along any line in the surface of the fluid in contact with some external interface, or thermodynamically, it can be understood to be the change in Helmholtz free energy per unit area change as the droplet forms (or spreads out) over a surface.
